CyberCyte
RISK AND THREAT EXPOSURE MANAGEMENT

Don't Let Attackers Exploit Shadow-IT to Stay Unnoticed.

Consolidate, Govern, and Respond with CyberCyte X-CTEM

1. What is the CyberCyte Platform

CyberCyte is an AI-driven platform and managed services delivery framework for threat exposure management, GRC, and remediation/response.

2. Why is CyberCyte Different?

CyberCyte's unified approach to threat exposure management, GRC, and remediation/response automatically transforms technical findings into governance risks, discovers security gaps, and eliminates Shadow-IT.

3. What Will It Deliver?

CyberCyte will identify previously unknown risks and reduce the organisation's operational overhead by 50% through its automated remediation and response capabilities. By enabling continuous security testing, security gaps are detected more quickly, and improvements to currently deployed solutions are regularly evaluated and refined.

4. Use Cases

- Shadow-IT is a problem for nearly every organisation. CyberCyte discovers and eliminates Shadow-IT with its AI-based artefact classification engine and remediation/response capabilities.
- Maintaining endpoint security agents and ensuring complete coverage is challenging. CyberCyte detects problematic endpoint agents, upgrades or repairs them, and ensures 100% coverage.
- CISOs require risk-oriented, consolidated analysis to track their resilience, benchmark their systems, and monitor progress. CyberCyte CISO Dashboard maps all the findings to business services, manages risks, measures organisational maturity, and tracks historical performance for continuous improvement.
- Organisations very often know their problems but lack the resources to resolve them. CyberCyte's unified approach to threat exposure management, GRC, and automated remediation/response enables organisations to overcome resource shortages.
- Many organisations invest in great tools but suffer breaches. CyberCyte enables automated penetration testing, compromise analysis, GRC assessments, and vCISO services through its partners and a network of renowned experts with global experience.

5. One Liner

Unmanaged assets are responsible for nearly 73% of security incidents, while cybersecurity teams face overwhelming information overload and alert fatigue. To combat this, CyberCyte X-CTEM threat exposure and GRC management platform consolidates threats, misconfigurations, and vulnerabilities across your assets, prioritises them based on business value, and executes remediation and response actions to reduce noise and eliminate the unknown.

6. Capabilities

- **Exposure Management**
  Discover security gaps, unknown risks, and shadow IT.
- **Attack Surface Management (ASM)**
  Continuously discover and analyse the organisation's internal and external digital assets.
- **Continuous Security Testing**
  Proactively identify exploitable vulnerabilities and assess an organisation's true risk exposure.
- **GRC Management**
  Streamline GRC processes and enable continuous risk management.
- **Third Party Management**
  Ensure third parties comply with the organisation's security policies through assessments, surveys, and attack-surface analysis.
- **Remediation & Response**
  Fix identified vulnerabilities, misconfigurations, and security gaps

7. How It Works

CyberCyte integrates to organisation's critical repositories like Active Directory, Intune, XDRs and Vulnerability Scanners to enable the following capabilities:

- Consolidate repository information.
- Cross-check repositories for validation.
- Validate the health of the endpoint agents.
- Execute diagnostic actions.
- Ensure 100% coverage for critical agents.
- Cloud systems configuration assessment.

To enable remediation/response, triage, and threat hunting, CyberCyte utilises its Windows/Linux/macOS-based agents and agentless data-collection for the following capabilities:

- Execute remediation/response.
- Collect 500+ artefacts from endpoints and network devices for vulnerabilities, threats and misconfigurations.
- Perform code-level vulnerability analysis.
- Collect telemetry and triage data.

8. Deployment Options

The solution is delivered as a multi-tenant SaaS platform with full support for on-premises, MSSP data centre, or CyberCyte Cloud-level deployments. Air-Gap deployments are supported. CyberCyte can also offer the deployment of a local LLM to ensure complete AI privacy.

9. MSSP Services

MSSPs can onboard their customers to tenants assigned to them. It is possible to create a deployment managed by the MSSP to ensure complete data privacy for its customers.

CTEM enables the MSSP to shift their SOC from responding to alerts to managing risk for its customers. The following services are available through the CyberCyte platform.

- Continuous Security/Penetration Testing
- Software Code Security Testing
- Crypto Security Analysis
- GRC Assessment (15 man/days)
- Compromise Assessment (25 man/days)
- Cyber Security Strategy Advisory (40 man/days)

10. Customer References

CyberCyte products are used across more than 10 verticals. The smallest customer has 10 endpoints; the largest customer has 25.000 endpoints and 4,000 servers. Major references and their main use case is summarised below:

An International Bank With 500+ Branches

Ensuring all systems comply with legal and regulatory requirements is essential for the bank. With CyberCyte, the bank centralises endpoint log collection and continuously verifies that security policies are consistently and correctly enforced across all systems. The platform allows the bank to identify gaps where assumed controls are not effectively implemented and to pinpoint high-risk assets requiring immediate attention. This visibility and prioritisation capability greatly enhances operational efficiency and reinforces the bank's overall compliance and risk management posture.

An Energy Distribution Company With 35 Million Customers

For an energy company operating critical infrastructure, maintaining full visibility and control over digital assets is essential. With CyberCyte, the company detects and mitigates Shadow IT by continuously discovering unmanaged or unauthorized assets across its environment. The platform ensures endpoint security agents are correctly deployed, operational, and up to date, reducing blind spots and minimising exposure risks.

Additionally, CyberCyte offers ongoing compliance monitoring by verifying that security configurations and regulatory controls are consistently enforced across IT and OT systems. By identifying enforcement gaps and prioritising high-risk assets, the company can take targeted measures, enhance operational resilience, and uphold a strong regulatory and cybersecurity position across distributed energy operations.

An International Conglomerate With 300+ Group Companies

For an international conglomerate operating over 300 group companies across various sectors and regions, maintaining consistent governance, risk, and compliance (GRC) standards is essential. With CyberCyte, the organisation centralises GRC management to establish unified policies, control frameworks, and reporting structures across all subsidiaries.

The platform supports continuous monitoring of cybersecurity maturity levels across group companies, giving executives insights into performance, control effectiveness, and risk posture variations. This allows leadership to benchmark entities, spot gaps, and prioritise remediation efforts based on measurable risk and business impact.

Meanwhile, CyberCyte continually detects and manages Shadow IT across the group, ensuring that unauthorised or unmanaged assets do not pose hidden risks to the organisation's attack surface. By combining centralised oversight with operational visibility, the conglomerate improves governance consistency, enhances accountability, and boosts overall enterprise resilience.

11. MSSP References

MSSPs have selected CyberCyte to deliver new services to their clients. The CyberCyte platform has been implemented in their data centres to allow their customers' data to be stored on their premises. Two of the use cases are below:

An MSSP Hosting 10000+ Managed Servers, 800+ Customers

For an MSSP managing over 10,000 servers across more than 800 customers, scalable visibility and swift response are crucial. With CyberCyte, the MSSP centrally gathers forensic artefacts and telemetry data, including PowerShell, Sysmon, and Windows Security logs to support threat hunting and incident response.

CyberCyte enabled centralised remediation across managed environments, ensuring consistent control enforcement and quicker containment. By prioritising assets based on business service value and consolidating threat, vulnerability, and misconfiguration findings through EDR and scanner integrations, the MSSP gained a unified, risk-based view across all tenants, improving operational efficiency and delivering measurable security outcomes at scale.

Consolidated Risk & Compliance Management for a Multi-Company Global MSSP

For an MSSP supporting over 300 companies and more than 26,000 end-users, maintaining consistent governance and risk visibility across all group entities was essential. With CyberCyte, the MSSP unified risk management across hosted companies, offering centralised oversight of threats, vulnerabilities, and control effectiveness.

The platform supported ISO 27001 certification processes by aligning controls, monitoring compliance status, and demonstrating audit readiness across tenants. Through dynamic posture management, CyberCyte validated the security of cyber assets, eliminated Shadow IT, and identified control gaps in real time.

By automating remediation and response actions, the MSSP ensured consistent policy enforcement and sped up risk reduction across its managed portfolio, boosting compliance and overall resilience.

12. Licensing

CyberCyte is licensed based on the number of end-user devices(workstations), servers, and cloud instances. For supplier management, the number of employees and suppliers is used. The GRC module can be purchased separately. There are three levels of licensing as summarised in the below table:

Feature Summary			
Feature Name	**BUSINESS**	**ENTERPRISE**	**PREMIUM/GRC**
Security Gap Analysis and Threat Hunting	X	X	X
Vulnerability Consolidation and Management	X	X	X
IT Asset Inventory Management (Cyber Asset Management)	X	X	X
Internal Attack Surface Visibility	X	X	X
External Attack Surface Visibility	1 Domain	1 Domain	1 Domain
CIS-Based System Configuration Analysis (Operating System, Applications)	X	X	X
Shadow IT Management	BASIC	AI POWERED	AI POWERED
Internal and External Infrastructure Security Test Automation	BASIC	AI POWERED	AI POWERED
Automated Remediation with Finding Automation	X	X	X
Patch Management	X	X	X
Application Installation and Update	X	X	X
Allowlist Management	X	X	X
Process Authorization Management	X	X	X
AI-Driven Finding Management and Automation		**X**	X
Regulatory Compliance (GRC) Management			**X**

13. FAQ

Please refer to the questions/answers below or request more details from CyberCyte by sending an email to partner@cybercyte.com

Q: I invested in an EDR/XDR and a major vulnerability scanner. What additional value will CyberCyte offer?

A: As a technology partner to key XDR vendors, CyberCyte consolidates findings from EDR/XDRs, vulnerability scanners and other systems. Their findings are then mapped to asset priority and business services. CyberCyte will also analyse critical artefacts, such as code library vulnerabilities, misconfigurations within systems, and asset data, which these systems often do not analyse. CyberCyte also validates that critical software, such as EDR, DLP, and PAM agents, is deployed correctly on every endpoint. Finally, integrated remediation/response actions, such as the automated deployment of critical endpoint agents, performing diagnostics, and applying configuration settings, will reduce the operational overhead of your IT Security Teams between 40% to 50%.

Q: What is the main problem CyberCyte is addressing? How are you solving it?

Seventy-three per cent of security incidents happen because of unmanaged assets, while

cybersecurity teams are overwhelmed by information overload and alert fatigue, mostly from their managed systems. To address this challenge, CyberCyte X-CTEM threat exposure and

GRC management platform consolidates threats, misconfigurations, and vulnerabilities from your assets, prioritises based on business value, and executes the remediation and response actions to minimise noise and eliminate the unknown.

Q: What will be the main benefit for my organisation?

CyberCyte guarantees 100% success in identifying unknown risks and provides a more accurate understanding of priorities based on business value. The visibility generated covers complex artefacts, such as malicious DLLs, vulnerabilities in software libraries, and misconfigurations in the OS, applications, and containers. All findings are ultimately connected to remediation and response actions for integrated lifecycle management. CyberCyte creates the validation layer every organisation needs to ensure to its systems are up-to-date and properly maintained.

Q: How do you position CyberCyte in the market?

CyberCyte is an AI-powered threat exposure and GRC management platform (X-CTEM) that integrates exposure management, GRC, and automated response.

Continuous Threat and Exposure Management (CTEM) is a new framework that enables organisations to continuously assess their risks and attack surfaces. Gartner indicates that the CTEM market will grow twice as fast as the cybersecurity market, and organisations implementing a CTEM program will reduce the risk of a breach threefold. CyberCyte is the platform and managed services framework that enables organisations to implement a CTEM program more quickly and at a lower cost.

Q: I lack the technical resources to maintain CyberCyte and am short on technical experts. How can CyberCyte help?

CyberCyte provides managed services that facilitate complete deployment, ongoing assessments, and regular review meetings. Your organisation will reduce cyber risks and maximise benefits with CyberCyte services. Deployment occurs within hours, as no initial integrations are needed. Using agent-based and agentless data collection, results are available immediately. During a free assessment, your organisation can determine its maturity level and identify areas for improvement. CyberCyte will decrease your operational overhead by 40% to 50%.

Q: How will CyberCyte reduce operational overhead?

- **Endpoint Agent Management**

  Problem: Multiple agents across EDR/XDR, logging, compliance, and vulnerability management cause deployment, maintenance, and compatibility issues.

  CyberCyte Impact: CyberCyte acts as a super-agent, automating deployment, health monitoring, and diagnostics for tools like CrowdStrike, Palo Alto Cortex XDR, Sysmon, and others.

  Estimated Overhead Reduction: 50–70% reduction in manual agent management tasks.

- **Configuration Benchmarking & Compliance**

  Problem: Enforcing hardening baselines (e.g., CIS, NIST, ISO 27001) typically requires manual audits and remediation across endpoints and servers.

  CyberCyte Impact: Automatically checks, applies, and remediates settings via prebuilt templates and scenario assessments (SIGMA/YARA), and maps findings to compliance frameworks.

Estimated Overhead Reduction: 40–60% less manual compliance effort.

- **Alert Fatigue & Manual Triage**

  Problem: Excessive alerts, false positives, and misclassified threats waste analyst time.

  CyberCyte Impact: AI-driven classification engine enriches and whitelists 300+ artifact types, significantly improving signal-to-noise ratio.

  Estimated Overhead Reduction: 30–50% faster triage and investigation.

- **Remediation & Response Automation**

  Problem: Manual patching, uninstalling, restarting services, or writing scripts consumes time.

  CyberCyte Impact: Enables single-click remediation via PowerShell, SSH, application installers, and OS patch management—all through a central interface.

  Estimated Overhead Reduction: 40–60% in operational effort for endpoint and infrastructure response.

- **Platform Consolidation**

  Problem: Fragmented tools across threat exposure, GRC, and diagnostics increase license and training costs.

  CyberCyte Impact: Provides unified visibility across threats, vulnerabilities, compliance, and inventory, reducing tool sprawl.

  Estimated Overhead Reduction: ~20–30% platform simplification benefit.
